# BONAFIDE CERTIFICATE

This is to certify that **Mr. Hemant Parshuram Bansode ,** PRN [2024048902], is a bonafide student of B.Sc. III (Computer Science), Semester V, of this college during the academic year 2026 – 2027.

He has successfully completed the On Job Training (OJT) of 60 hours (4 Credits) as per the curriculum prescribed by Shivaji University, Kolhapur, at **I Base Electrosoft LLP (Branch Pune)** during the period **20th July 2026** to **20th September 2026** and has submitted this report titled "Report on On Job Training" in partial fulfilment of the requirement for Semester V.

This report is a record of work carried out by the student and has not been submitted elsewhere for the award of any other degree or diploma.

**OJT Coordinator** **Head, Department of Computer Science**

Name: _____

**External Examiner**

# DECLARATION

I, HEMANT PARSHURAM BANSODE , hereby declare that this report entitled “Report on On Job Training” submitted for Semester V, B.Sc. (Computer Science), is a record of genuine work carried out by me at **IBase Electrosoft LLP (Branch Pune)** during the period **20th July 2026** to **20th September 2026**, under the guidance of Miss. S. S. Ghorpade and Mr. Nakul Deshmukh.

I further declare that this report is the result of my own work and has not been submitted, in part or full, to this or any other University/Institute for the award of any degree or diploma.

**DATE:**

**PLACE: Islampur**

| Student Name | No | Signature |
|---|---|---|
| **HEMANT PARSHURAM BANSODE** | | |

# ACKNOWLEDGEMENT

I take this opportunity to express my sincere gratitude to **IBase Electrosoft LLP (Branch Pune)** for providing me the opportunity to undergo On Job Training and gain valuable industrial exposure.

I am deeply thankful to **Mr. Nakul Deshmukh, CEO**, for his constant guidance, encouragement, and support throughout the training period, and for patiently clarifying my doubts.

I would also like to thank Miss. S. S. Ghorpade, Department of Computer Science for his/her valuable guidance and for facilitating this OJT as part of the Semester V curriculum of Shivaji University, Kolhapur.

I extend my sincere thanks to the Principal Dr. A. M. Jadhav and the Head of the Department of Computer Science Mr. N. R. Jagtap for their continuous support and for granting permission to undertake this training.

Finally, I am grateful to my family and friends for their constant encouragement and support throughout this training and the preparation of this report.

**HEMANT PARSHURAM BANSODE**

# 1.Introduction

Introduction Tourism is an important part of modern life, providing opportunities for people to explore new destinations, experience different cultures, and discover historical and natural attractions. With the rapid growth of digital technology, tourists increasingly depend on online applications to search for destinations, obtain useful information, and plan their trips.

The Tourist Places Explorer Using APL project is designed to provide an easy and convenient way for users to explore tourist destinations through a digital platform.

Project Overview The proposed system helps users discover tourist places by presenting relevant information about destinations in an organized and accessible manner. Users can explore places based on available information such as location, description, attractions, and other useful travel details.

The application aims to reduce the time and effort required to collect information from multiple sources and provides a centralized platform for destination exploration.

Need for the System Traditional methods of planning a trip often require users to search through several websites, maps, travel blogs, and other sources. This can make it difficult to compare destinations and obtain reliable information quickly. A dedicated tourist-place explorer can organize destination information in one place, making the exploration process simpler, faster, and more user-friendly

**OBJECTIVES**

| Objective | Description |
|---|---|
| Easy exploration | Provide a simple interface for discovering tourist destinations. |
| Destination information | Present useful details about selected tourist places in an organized format. |
| Search and discovery | Help users locate destinations according to their interests or requirements. |
| Better trip planning | Support users in collecting basic information before visiting a destination. |
| User convenience | Reduce the need to search across multiple information sources. |

Scope of the Project The system can be used as a digital guide for exploring tourist destinations. Its scope includes displaying destination details, supporting search and browsing, and presenting information in a structured manner. The project can also be extended in the future with features such as maps and navigation, user reviews and ratings, personalized recommendations, itinerary generation, weather information, hotel and transportation information, and multilingual support.

Conclusion The Tourist Places Explorer Using APL project provides a practical approach to digital tourism and destination discovery. By bringing useful tourist information into a single application, the system can make destination exploration more convenient and support users in making informed travel plans. The project also provides a foundation for developing a more comprehensive smart-tourism application in the future.

# 2.THEME OF PROJECT

| | |
|---|---|
| Project Type | Tourism / Information Explorer |
| Programming Language | APL |
| Main Theme | Main Theme Discovering Tourist Destinations |
| Target Users | Tourists, Students & Travel Enthusiasts |

## 2.1 Project Introduction

Tourist Places Explorer Using APL is a software project focused on making tourism information easier to explore and organize. The application provides a structured way for users to search and discover tourist places based on location, category, or other useful destination details. The project uses APL (A Programming Language) to demonstrate how array-oriented programming can be applied to a practical tourism-related problem. The system can process collections of destination data efficiently and present meaningful information to the user.

## 2.2 Project Theme

"Discover the World, One Destination at a Time." The central theme is smart tourism exploration. The project combines technology and travel information to create a simple, user-friendly destination explorer. It is designed around the idea that travelers should be able to quickly discover places, compare basic information, and make informed travel plans.

## 2.3 Objectives

• Create an easy-to-use system for exploring tourist destinations. • Store and process tourist-place information in a structured format. • Use APL's array-processing capabilities to handle destination data. • Allow users to search or filter places according to selected criteria. • Present useful information such as location, category, attractions, and description. • Demonstrate a real-world application of APL programming concepts.

### 2.4 Key Features

| Feature | Purpose |
|---|---|
| Destination Search | Find tourist places using keywords or selected criteria. |
| Category Exploration | Browse places such as historical, natural, cultural, or adventure destinations. |
| Place Information | Display descriptions and important details about destinations. |
| Filtering | Filtering Narrow results based on location or category. |
| APL Data Processing | APL Data Processing Use arrays and APL operations to process destination records. |
| User-Friendly Output | Present results in a clear and understandable form. |

### 2.5 Technology & Programming Concept

The project is based on APL, an array-oriented programming language. APL is well suited to operations involving collections of values because many computations can be expressed compactly using array operations. In this project, APL can be used for searching, filtering, sorting, grouping, and processing tourist-place data.

### 2.6 Expected Outcome

The completed project will provide a functional tourist-place exploration system that demonstrates the practical use of APL. Users will be able to explore destination records and obtain relevant information through simple search and filtering operations. The project also demonstrates how a specialized programming language can be applied to a real-world information-management problem.

### 2.7 Future Scope

- Add maps and location-based navigation.
- Include images, ratings, opening hours, and travel tips.
- Add personalized recommendations based on user interests.
- Connect the application to live tourism or map APIs.
- Add itinerary creation and trip-planning features.
- Expand the destination database to include national and international locations.

# 3.MOTIVATION OF THE PROJECT

Tourism is an important part of modern life that allows people to explore new destinations, experience different cultures, learn about historical places, and enjoy natural attractions. However, finding complete and useful information about tourist places can sometimes be difficult because information is available across different sources.

The motivation behind the **Tourist Places Explorer Using APL** project is to develop a simple and user-friendly application that helps users explore tourist destinations in an organized and convenient way. The application aims to provide useful information about different tourist places and make the process of exploring destinations easier for users.

**Main Motivations**

1. Easy Access to Information
   The project provides users with convenient access to information about various tourist destinations.
2. Exploration of New Places
   It helps users discover historical, natural, cultural, and recreational tourist attractions.
3. Organized Information
   Tourist-place information can be presented in a clear and structured format, making it easier for users to understand.
4. Application of APL Programming
   The project provides an opportunity to apply APL programming concepts to a practical real-world problem.
5. Improved User Convenience
   The system can reduce the time and effort required to search for information about tourist destinations.
6. Educational Purpose
   The project helps students improve their programming, logical thinking, data-handling, and problem-solving skills through the development of a practical application.

**Expected Outcome**

The Tourist Places Explorer Using APL project is expected to provide a simple platform for exploring tourist destinations while demonstrating the practical use of APL programming. The project can make destination information easier to access and provide users with a convenient way to explore different tourist places.

**Conclusion**

The main motivation of this project is to combine technology and tourism to create a useful and easy-to-use application. By using APL, the project demonstrates how programming can be applied to solve everyday information-search problems and create a practical tourism-related system.

# 4.PROBLEM STATEMENT

Tourists often face difficulties when searching for suitable tourist destinations and collecting useful information about different places. Information about tourist attractions, their locations, categories, and other details may be scattered across different sources, making the process time-consuming and inconvenient.

There is a need for a simple and organized system that allows users to explore tourist places efficiently. The system should provide relevant information about different destinations and allow users to search and explore places according to their requirements.

The Tourist Places Explorer Using APL project aims to address this problem by developing an application using APL programming. The application will organize tourist-place information and provide an easy way for users to explore available destinations.

## 4.1 Objectives of the Problem Statement

- To provide an organized collection of information about tourist places.
- To make searching and exploring tourist destinations easier.
- To reduce the time required to find relevant tourist-place information.
- To provide a simple and user-friendly interface for exploring destinations.
- To demonstrate the practical application of APL programming.
- To improve the organization and accessibility of tourism-related information.

## 4.2 Proposed Solution

The proposed system, Tourist Places Explorer Using APL, will maintain information about different tourist destinations and allow users to explore the available places. Users can search or browse destinations and obtain relevant information in a structured manner.

The project demonstrates how APL can be used for data processing, searching, and organizing information to develop a practical tourism-related application.

The Tourist Places Explorer Using APL is proposed as a simple application that organizes information about different tourist destinations in a structured manner.

The system will allow users to explore tourist places and search for relevant information conveniently. APL programming will be used to store, process, search, and display tourist-place data.

The proposed solution aims to:

- Provide tourist information in an organized format.
- Allow users to search and explore different destinations.
- Reduce the time required to find tourist-place information.
- Make destination exploration simple and convenient.
- Demonstrate the practical use of APL programming.
- Provide an easy-to-understand interface for users.

### 4.3 PROJECT SCOPE

The scope of the Tourist Places Explorer Using APL project includes the development of a basic application for storing, searching, and displaying information about tourist destinations.

**The project will cover:**

- Tourist Place Database: Maintaining information about selected tourist destinations.
- Place Categories: Organizing destinations into categories such as historical, natural, cultural, and recreational places.
- Search Function: Allowing users to search for tourist places using relevant information such as name or category.
- Information Display: Displaying important details about selected tourist destinations in a structured format.
- Data Processing: Using APL to store, manipulate, filter, and process tourism-related data.
- User-Friendly Interaction: Providing a simple interface through which users can explore available destinations.
- Academic Demonstration: Demonstrating the practical application of APL programming concepts in a real-world project.

**Limitations of the Scope**

The project is primarily focused on exploring and managing tourist-place information. Advanced features such as real-time GPS navigation, online hotel or ticket booking, live weather updates, payment processing, and real-time travel tracking are outside the scope of the basic project.

### 4.4 EXPECTED RESULT

The proposed system will provide a convenient way for users to explore tourist destinations while demonstrating how APL can be used to develop a practical, real-world application. It will also help students understand data organization, searching, filtering, and processing using APL.

# 5.METHOD USED

The Tourist Places Explorer Using APL project follows a systematic methodology to collect, organize, process, search, and display information about tourist destinations. APL (A Programming Language) is used as the primary programming language because of its powerful array-processing and data-manipulation capabilities.

**5.1 Requirement Analysis**

The first step is to identify the requirements of the proposed system. The project determines what information users need about tourist places and what operations the application should perform.

The main requirements include:

- Information about different tourist places.
- Classification of places into suitable categories.
- Searching for tourist places.
- Filtering places according to user requirements.
- Displaying destination information in an organized format.

**5.2 Data Collection**

Information about selected tourist destinations is collected and prepared for use in the application. The data may include:

- Name of the tourist place
- Location
- Category
- Description
- Important features or attractions

The collected information is checked and organized before being entered into the system.

**5.3 Data Organization Using APL**

The collected tourist-place information is represented using suitable APL data structures such as vectors and arrays. Related information is organized systematically so that it can be accessed and processed efficiently.

APL's array-oriented approach allows multiple records and values to be handled efficiently with fewer repetitive operations.

## 5.4 Data Processing

The organized data is processed using APL operations. The system performs operations such as:

- Selection of records
- Comparison of values
- Filtering of data
- Sorting of information
- Accessing specific records
- Processing multiple records simultaneously

This processing converts the stored information into useful results for the user.

**5.5 Search Method**

A search function is used to help users find specific tourist destinations. The user can provide a search value such as a place name, location, or category.

The system compares the entered value with the available tourist-place data and identifies matching records. The matching information is then displayed to the user.

**5.6 Filtering Method**

Filtering allows users to narrow down the list of tourist places according to specific requirements. For example, users may select a particular category such as:

- Historical Places
- Natural Places
- Cultural Places
- Religious Places
- Recreational Places

**5.7 Information Display**

After searching or filtering, the selected tourist-place information is displayed in a clear and organized manner. This makes it easier for users to understand the available destinations and select places according to their interests.

**5.8 Testing**

The developed system is tested using different tourist-place records and search conditions. Testing verifies that the application correctly stores, processes, searches, filters, and displays information.

The following cases are tested:

- Valid tourist-place searches
- Category-based searches
- Multiple tourist records
- Unmatched search values
- Empty or incorrect input
- Correct display of destination information

### 5.9 Result Evaluation

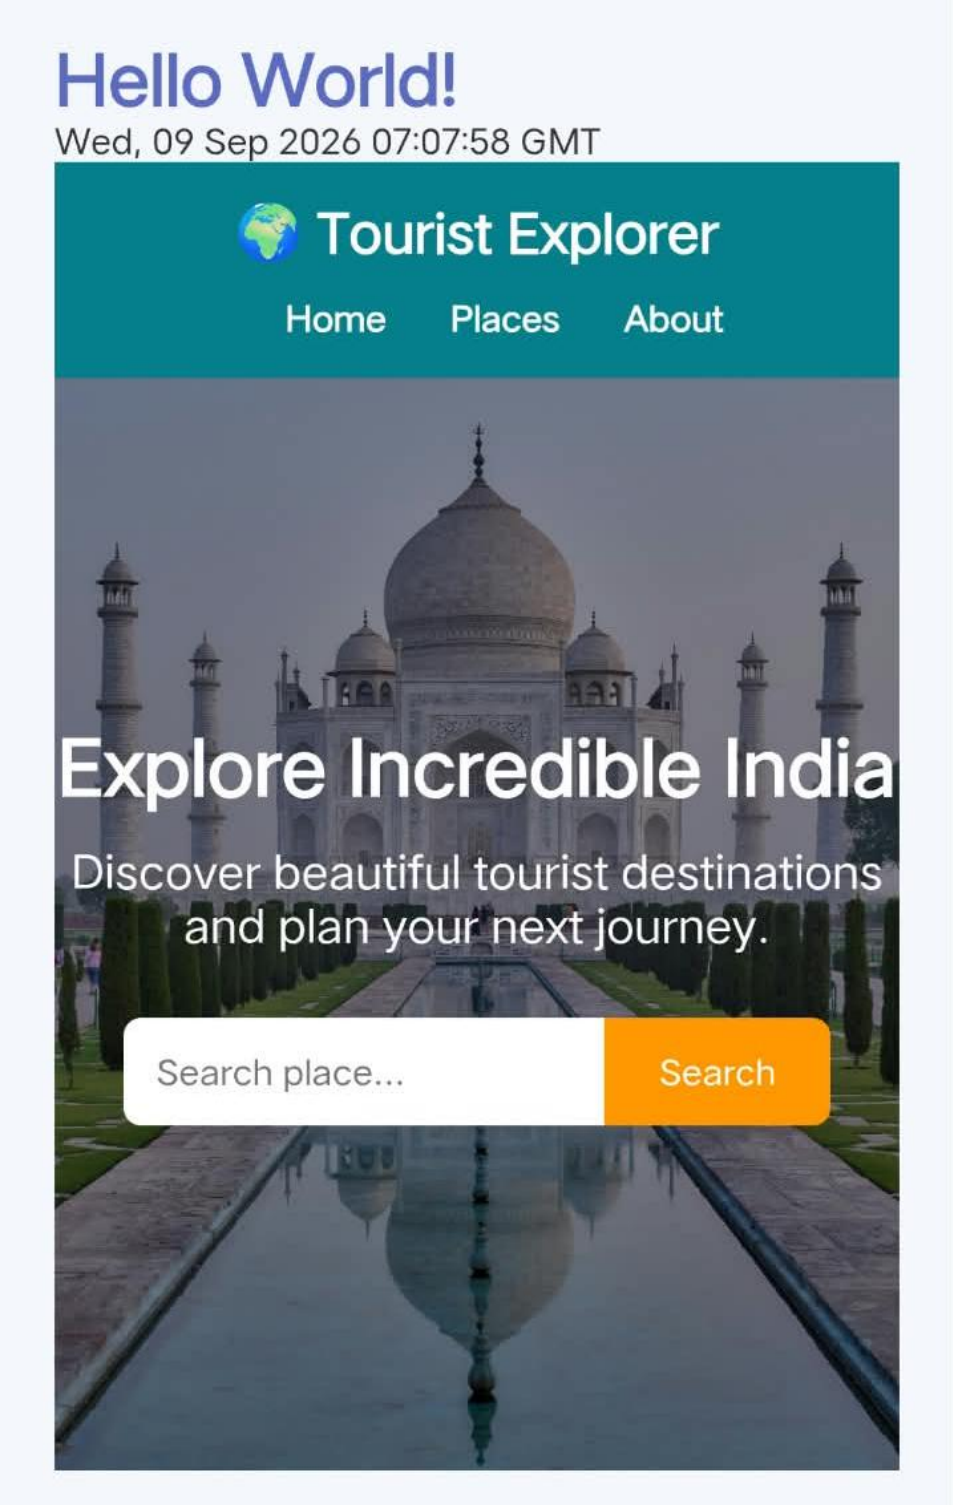

The final application is evaluated based on its ability to provide relevant tourist-place information efficiently. The project is also evaluated on the practical implementation of APL concepts such as arrays, data processing, searching, selection, and filtering.

**ADVANTAGES OF THE METHOD**

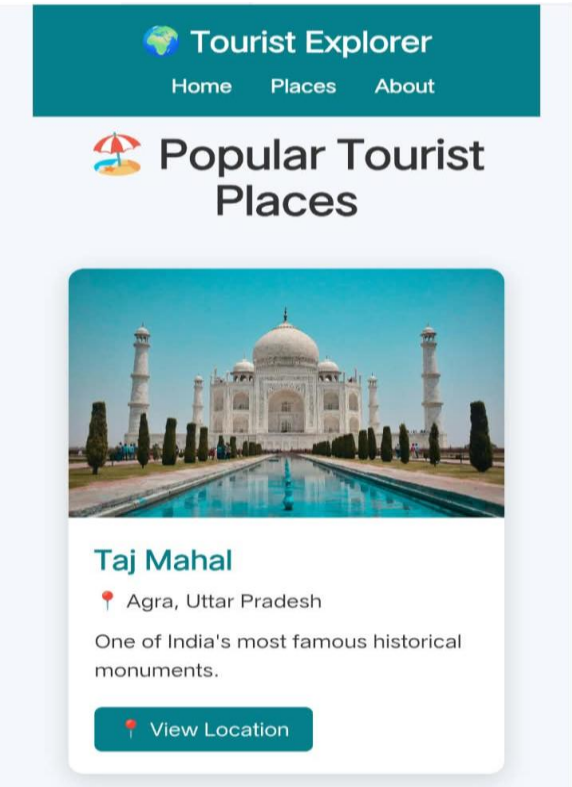

- Provides a systematic approach to developing the project.
- Organizes tourist information efficiently.
- Makes searching and filtering easier.
- Demonstrates the practical use of APL.
- Uses APL's array-processing capabilities.
- Provides a simple and convenient way to explore tourist destinations.
- Helps students understand data processing and programming concepts.

About Tourist Explorer
Tourist Places Explorer is a web-based project designed to help users discover popular tourist destinations in India. Users can search for places, view attractive images, read short descriptions and open the location

## 7.CONCLUSION

The Tourist Places Explorer Using APL project successfully demonstrates the use of APL programming to develop a simple and organized system for exploring tourist destinations. The project provides a structured approach to storing, processing, searching, filtering, and displaying information about different tourist places.

By using APL's powerful array-processing and data-manipulation capabilities, the system can efficiently handle tourism-related information. Users can explore tourist destinations based on available details such as place name, location, and category.

The project also provides practical experience in important programming concepts such as data organization, arrays, searching, filtering, selection, data processing, and user interaction. It demonstrates how a programming language can be applied to solve a real-world information-management problem.

Overall, the project provides a simple and useful approach to tourist-place exploration while fulfilling its academic objective of demonstrating the practical application of APL programming. It also provides a foundation for developing a more advanced tourism application in the future.

These enhancements can transform the basic Tourist Places Explorer Using APL into a more comprehensive tourism platform. By adding mapping, recommendations, reviews, travel planning, real-time information, and mobile support, the system can become more useful for tourists while providing opportunities for further development and learning.

# 8. FUTURE ENHANCEMENT

The current Tourist Places Explorer Using APL project provides a basic platform for organizing and exploring tourist destinations. The system can be further enhanced with additional features to make it more interactive, intelligent, and useful for travels.

### 8.1 Interactive Maps and GPS

The system can be integrated with digital maps and GPS services to show the exact location of tourist destinations and provide navigation from the user's current location.

### 8.2 Online Database

A centralized online database can be introduced to store a larger number of tourist destinations. This would allow information to be updated without modifying the main application.

### 8.3 User Login and Profiles

User authentication can be added so that users can create personal profiles, save their destinations, and maintain their travel preferences.

### 8.4 Personalized Recommendations

A recommendation system can be developed to suggest tourist places based on users' interests, preferred categories, previous searches, and selected locations.

### 8.5 Reviews and Ratings

Users could be allowed to provide reviews and ratings for tourist destinations. This would help other users understand the experiences of previous visitors.

### 8.6 Travel Planning

A future version could include a trip-planning feature where users can create itineraries, select multiple destinations, and organize their travel schedules.

### 8.7 Weather Information

Real-time weather information could be integrated to help users check weather conditions before visiting a destination.

### 8.8 Hotel and Transportation Information

The application could be expanded to provide information about nearby hotels, restaurants, transportation facilities, and other services.

### 8.9 Multilingual Support

Multiple languages could be added to make the application accessible to users from different regions and backgrounds.

### 8.10 Mobile Application

The project could be developed as a mobile application for Android and iOS devices, allowing users to explore tourist destinations while travelling.

### 8.11 Improved User Interface

The user interface can be enhanced with images, interactive maps, icons, and better navigation to provide a more engaging user experience.

### 8.12 Advanced Data Analysis

APL's data-processing capabilities can be further utilized to analyze tourism data, identify popular destinations, and generate useful statistics.
